

HOW TO IMPLANT SUPRELORIN

1. Remove the cap from the implanter

2. Attach the actuator to the implanter

3. Lift the loose skin between the shoulder blades. Insert the entire length of the needle subcutaneously.

4. Fully depress the actuator plunger and, at the same time, slowly withdraw the needle. Press the skin at the insertion site as the needle is withdrawn, and maintain pressure for 30 seconds.

5. After implantation, the spacer (transparent light blue) is visible. The implant (opaque white) should not be visible. It may be possible to palpate the implant *in situ*.

6. It will take maximum 6 weeks to obtain a complete infertility. The effect will last minimum 6 months with Suprelorin 4.7mg. It is necessary to adapt the diet as for any sterilized dog.
